

# REMOTE WORK: AN EXAMPLE OF HOW TO IDENTIFY A DOWNTOWN-RELATED TREND BREEZE THAT PROBABLY WILL OUTLAST THE COVID19 CRISIS

September 1, 2020

---

By N. David Milder

## Introduction

Opining experts have noted several trends or phenomena emerging during the Covid19 crisis that might have serious long-term impacts on our downtowns and Main Street districts. Among them are:

- Greater use of sidewalks and public spaces for commercial and leisure purposes.
- Acceleration of the process of creative destruction in the retail industry due to greater online sales.
- Changes in commuting patterns, with public transit use declining and single passenger auto commuting strongly resurging .
- A resurgence of small merchant startups as the crisis ebbs.
- Growth in remote working.

This article will focus on remote working and use it to try to outline how we might now make a decently reliable decision about whether or not a putative trend that has attracted attention during the Covid19 crisis is worthy of that attention because it will *probably* endure and be seriously impactful well past the current crisis.

**Trends and Trend Breezes.** To say that phenomena are real trends we must, at a minimum, be certain of their present existence. That is usually fairly easy to determine. However, there are a number of other questions about them around which there can be greater uncertainty. Will they persist long into the future? Will they maintain their current characteristics and strengths? What will their impacts be? The trends or phenomena around which there is such uncertainty should more properly be called *trend breezes*, since while they definitely now exist and are being observed, their strength, intensity, direction and longevity have potentials of considerable variation. When their strength, intensity and direction acquire better known and predictable ranges, then they truly can be called real trends. However, even with trend breezes, though our knowledge is incomplete, we might now know or learn enough to identify *those most likely to endure* and have significant impacts, and consequently do viable and useful *contingent planning*.

## Some Knowns

Analytically, looking at these trend breezes, we are not in a state of total ignorance. There are some realities that we now know with a good deal of certainty that can ground our critical thinking about them:

- *Crises very often are associated with major social, economic and/or political changes, often disrupting previously well embedded behaviors, attitudes and institutions.* At times, the changes they spark initially appear minor or go unnoticed. We should be on alert for important changes the Covid19 crisis may unleash and try to differentiate between those with strong and weaker potentials for longevity and impacts.
- *Crises tend to reinforce or mutate existing trends.* One very important way this is done is that the crisis reinforces the weakness a trend was already inflicting on some people and organizations, and may also reinforce the rewards it gives to others. Prior to the Covid19 crisis, many parts of our society and economy already were in a mutating, strengthening, weakened, or fragile condition: 1) retail chains, small retailers, restaurants, personal service operations, small cultural/arts/entertainment organizations; 2) the millennial and GenZ age cohorts 3) various racial and ethnic groups; 4) online businesses (e.g. Amazon) and social media(e.g., Facebook and Twitter) had enormous growth.
- *The mechanism through which Covid19 has its greatest impact on existing downtown related trends and spawning new ones has been through our need for social distancing.* It is disturbing the way we work, how we travel, how we shop, and how we play.
- *However, while the intensity of the need for distancing is likely to diminish with the emergence of a vaccine, an effective therapeutic, or community immunity, it may last long enough to unleash changes in behaviors or strongly strengthening the levels of existing behaviors that then are kept on long-term for a variety of reasons unrelated to public health. This is an important key to their longevity and strength.*
- *They do so because they strongly meet some of the other needs or wants of various groups of people or organizations.* For example, while the emergence of residential indoor plumbing in the 19<sup>th</sup> century was sparked by a response to major outbreaks of cholera, typhoid and yellow fever, its popularity grew for reasons unrelated to the need of coping with those diseases. Indoor plumbing become a highly desirable and necessary amenity in its own right. Today, our often palatial bathrooms have little to do with our hygienic needs.
- *In general, trends last when they have large levels of user buy-ins by various groups.* A good example of this was the growing flight to the suburbs after WW II, when real estate developers, local government officials, retailers and consumers all sparked its growth.
- *Crises can unleash trend breezes that are reinforced by other trend breezes.* For example, the increased risk and reduced use of mass transit can reinforce remote work. This increases their likelihood of turning into real trends .
- *The impacts of these trend breezes can vary in strength. From a downtown revitalization perspective, our concern should be on those that are already displaying significant impacts, or that can be analytically shown to have such large potential impacts that they warrant attention now.*
- *The strength of trend breezes can vary geographically, so different types of downtowns probably will affected differently by them.* For example, remote work may reduce the demand for office space, eateries and retail in our larger downtowns, but provide a

significant new consumer market segment for suburban residential landlords and developers, retailers, and eateries.

- *We must recognize what we don't know.* At this moment, we still do not know with any accuracy or certainty about a lot of things including how many downtown businesses have closed for good, how many have been severely weakened, or when consumer spending and employment levels will return to acceptable levels.
- *We live in a really uncertain world, where we often need to act on less than perfect information.* Many actions are taken without any sense of absolute certainty. Most businesspeople, political leaders and officials, and most of us in everyday life, need to make decisions and plans based on less than perfect information, but information that is deemed the best we can get, and at least good enough to make a decision. This usually involves individuals making subjective probability estimates about the reliability of the decision-related information they are considering, and the outcomes of the actions they might take.
- Consequently, with regard to trend breezes, an analytical procedure that can help decision-makers determine whether a Covid19-related trend breeze will probably have an impactful existence after the crisis wanes is likely to be of considerable value.

### Some Criteria for Assessing the Potential Longevity of Trend Breezes

From the above, I would suggest the following criteria for identifying trend breezes that are likely to last and become true trends:

1. There are reliable data that support the current existence of the trend breeze.
2. It existed, even if at a weaker level, before the Covid19 crisis. This signal is even stronger if it was growing prior to the crisis.
3. It helps people and/or organizations cope with crisis conditions.
4. There are large important "user groups" sparking its growth.
5. The groups are engaging in trend related behaviors for non-health reasons that can endure once the Covid crisis has ebbed.
6. There other trends or trend breezes that reinforce the trend breeze in question.
7. The potential post crisis impacts of the trend breeze are deemed significant enough to warrant attention.
8. There is an identifiable geographic variation in the presence of the trend breeze, and it affects its potential prevalence – we can have a good idea where the trend will and will not be strong.

### Remote Working

One might reasonably argue that were it not for remote work our economy today would be far worse off. It has kept many companies alive and enabled the high tech industries to even prosper during this crisis.

**Remote Working Pre-Covid.** Seeds of the internet date back to 1962, but the version that first approximates how we know it today appeared in 1991 with the World Wide Web. By 1993, Phil

Burgess had noted the emergence of “lone eagles” who could use telecommunications assets, including the emerging internet, to maintain sophisticated and well-paying jobs while living in high quality of life locations distant from major metropolitan areas.<sup>1</sup> Later in the 1990s and early 2000s, telecommuting was a hot topic, and some observers saw it leading to a decentralization of economic power to less densely populated areas. Cyber districts were briefly hot as a revitalization strategy. Joel Kotkin’s *The New Geography* book for example, saw cities flourishing if they were situated on large fiber optics pipes and could offer the types of lifestyle assets knowledge workers liked.

But, this decentralization never came to pass, and the terminology shifted from telecommuters and lone eagles to remote workers. The data most often used by analysts to identify remote workers/telecommuters/lone eagles are from the Census Bureau’s America Community Survey (ACS) that asks members of about 3.5 million households a question about how they get to work. Full-time employees who answered, “worked at home” to the question, “What was your primary means of transportation to work during the survey week?” are considered remote workers. *In 2015, only about 3% of the US workforce worked from home at least half of the time, an increase of 115% since 2005.*<sup>2</sup> Most of the reports about remote workers have come from firms and organizations that have an interest in their growth, so their write ups tend to focus on the more impressive growth percentages, than their current absolute numbers or percentage of the workforce.

In 2014, Kotkin and Cox did a follow up study on lone eagles in our 52 largest metropolitan areas and cities over 25,000. They found, using the ACS data, places with numbers high enough to command some attention:

- “... (The met areas)) with the highest proportions of home-based workers are generally those with high-tech, information-based economies. Tops is San Diego, a major center for digital and biomedical businesses, where 6.6% of workers are based at home
- “...T)he bulk of our leading work-at-home locales are tech-oriented suburbs or exurbs. These include several communities around the often traffic-clogged greater Atlanta area, including No. 2 John’s Creek (13.1%) and No. 6 Alpharetta (10.6%).
- “More than 5 million Americans aged 55 or older run their own businesses or are otherwise self-employed, according to the Small Business Administration, and their numbers soared 52% from 2000 to 2007....This entrepreneurial push could correlate with the movement of aging boomers to more rural communities, and sleepier outer suburbs. Contrary to the much-hyped notion of a ‘back to the city’ movement among boomers, Census research suggests that if they move at all, most head further to the periphery. At the top of our list of communities over 25,000 is the coastal North Carolina city of Jacksonville, home to the Marine Corps’ Camp Lejeune and a good number of military retirees. A remarkable 13.8% of the people in this highly affordable, scenic community of 70,000 work out of their homes, roughly three times the national average. The median home price in Jacksonville: \$141,000.”<sup>3</sup>

**Estimate of Percentage of Employees in Gallop Study Who Worked Remotely 80% to 100% of the Time**

Year		Percent of Employees Who..
2012	2016	
39%	43%	Worked any portion of their time remotely
24%	31%	Worked 80% to 100% of their time remotely
<b>9.4%</b>	<b>13.3%</b>	Estimated percent of all employees who worked remotely 80% to 100% of their time.

Source. Gallop. *State of the American Workplace*. December 2016. p151. <http://news.gallup.com/reports/199961/state-american-workplace-report-2017.aspx>

Gallup developed *State of the American Workplace* using data collected from more than 195,600 U.S. employees via the Gallup Panel and Gallup Daily tracking in 2015 and 2016, and more than 31 million respondents through Gallup's Q12 Client Database. First launched in 2010, this is the third iteration of the report.

Gallop has a huge survey panel of about 195,000 US employees that are drawn from establishments likely to be incorporated and have employees. Its samples consequently probably reflect a different population than the general population tapped by the ACS, and one that probably better reflects what is happening in companies with lots of employees officed in our larger cities.

The table on the left shows that in 2016, 43% of their respondents worked at least some of the time remotely and that 31% of them worked 80% to 100% of their time remotely. *Consequently, it is possible to calculate that 13.3% of all these employees worked 80% to*

*100% of the time remotely.* Moreover, that percentage is a substantial increase over the 9.4% estimated for 2012. They are fulltime or very close to fulltime workers. Since the percentage of remote workers increases with the total number of employees a firm employs, *looking only at firms that have at least 5,000 employees would mean that just those firms had about 5.4 million fulltime or almost fulltime remote jobs in 2016.*

These findings by Gallop suggest that the level of fulltime remote working was probably far more extensive pre-Covid in the types of firms found in our major downtowns, 13%-14%, than the national ACS data might indicate,3%. The Kotkin-Cox study shows that, even if we generously interpret people who work at home as remote workers, the peak level for a city, large or small also was about 13%. However, the fact that Gallop found that about 30% of its surveyed workers worked remotely at least part-time in the pre-crisis period, indicates that a lot more of them could easily become fulltime remote workers, because they had a significant amount of experience doing it.

The Great Recession Trend Breeze. During that crisis, there also was a noticeable, if not large increase in the number of corporations interested in ramping up their remote work programs because of its ability to tap larger talent pools and especially its ability to reduce expenditures for renting expensive office spaces. However, this interest waned as the economy improved.

The Open Office Model of Working. An important factor that helped thwart the growth of remote work was a kind of flash flood adoption of the “open office” model for utilizing office spaces that was made famous by some very successful high tech firms such as Goggle and

Apple. It supposedly stimulated creativity by fostering spontaneous social interactionists. Yahoo once had a very large remote workforce, but when Marisa Mayer -- habituated to Google's famed open offices -- took over, she famously shut down the remote working. The Covid19 crisis, however, has sparked a need for social distancing that has seriously weakened the viability of the open office model.

**Levels of Remote Work During the Covid19 Crisis.** Many major corporations, often those with large downtown office spaces – e.g., Google, Microsoft, Morgan Stanley, JPMorgan, Capital One, Zillow, Slack, Amazon, PayPal, Salesforce -- quickly responded to the need for social distancing by encouraging and facilitating their employees to work at home.<sup>4</sup> Several other high tech companies such as Twitter, Square, Facebook, Shopify, Box and Slack have already indicated that either all of their workers or very substantial portions of them can work at home even after the pandemic is over.<sup>5</sup>

Research on the Level of Remote Work Based on Surveys of Workers. Two survey research approaches have been used to study how the Covid19 pandemic has influenced remote working. One is to survey workers, the other is to survey corporate officials. Using the first approach, in April and May of 2020 a team at MIT used Google's online survey tool in two waves and had over 50,000 individual respondents. That is a huge sample, but biased toward only those with internet access, so it will be somewhat overstating the level of remote work in the nation's workforce. Nonetheless, its findings indicate that the pandemic greatly increased the number of remote workers, and at a level – about 300+% -- that has not been seen before: "Of those employed pre- COVID-19, ... about half are now working from home, including 35.2% who report they were commuting and recently switched to working from home."<sup>6</sup>

Research on the Level of Remote Work Based on Surveys of Company Officials. Surveys by The Federal Reserve Bank of New York of business leaders in its region in April of 2020 found that those in service industries were reporting 60.5% of their workforces were now working from home, while those in manufacturing industries were reporting remote work at 26.5%. Both numbers are much higher than the pre-crisis national levels described above.<sup>7</sup>

A team at the Harvard Business School, with a national research perspective, issued an insightful working paper in June 2020 also based on surveys of business officials. They had several important findings:

- The overall levels of remote work are high. About 45% of those in smaller businesses reported having at least some of their employees working remotely, averaging about 22% of their workforces. The larger firms averaged 79% of their workforces working remotely.
- However, there is considerable variation across industries. The research by Dingel and Neiman about which occupations and industries are more suited for remote work did "a remarkably good job of predicting the industry level patterns of remote work." (More about this below).
- Remote work is much more common in industries with better educated and better paid workers.

- “Employers think that there has been less productivity loss from remote working in better educated and higher paid industries.”
- “(M)ore than one-third of firms that had employees switch to remote work believe that remote work will remain more common at their company even after the COVID-19 crisis ends.”<sup>8</sup>

**Vulnerability Group by County**

Search in table Page 1 of 104 >

Name	State	Vulnerability
Autauga	Alabama	Low
Baldwin	Alabama	No

Etowah	Alabama	Low
Fayette	Alabama	High
Franklin	Alabama	High

Table: RG • Source: PCRD • [Get the data](#) • Created with [Datawrapper](#)

Figure 1 lists the share of counties with no, low, moderate, and high vulnerability.

The major value of the HBS study is the confirmation of the important research by Dingel and Neiman about the occupations and industries most prone for remote work. The industries they found with the highest shares of jobs that can be done at home are : Educational Services, 83%; Professional, Scientific, and Technical Services, 80%; Management of Companies and Enterprises, 79%; Finance and Insurance ,76%; Information, 72%. Among the least prone industries are retail trade, 14%, and accommodations and food services, 4%. Arts, Entertainment, and Recreation was also relatively low at 30%.<sup>9</sup> This study combined with the HBS team study show that we now know not only about the new levels of remote work, but also about the industries in which it is most likely to grow. Also very evident is the fact that those with the greatest potentials for remote work, current and future, are those that occupy large proportions of the office spaces in our larger downtowns. On the other

hand, those industries that are more likely to occupy storefronts in many downtowns have very modest to low potentials for remote work. These propensities are unlikely to change in the foreseeable future.

**Geographic Variation.** Roberto Gallardo and Richard Florida have created and made available to the public – see chart above on left -- a very interesting data set that also builds on the Dingel-Neiman findings to measure how prepared over 3,000 counties are for developing a significant remote work capability given their existing workforces. They begin with the conclusions that:

“... a substantial share of Americans will be working remotely for the foreseeable future. Surveys and polling data suggest that more Americans desire to work remotely in the wake of the current health crisis. And we can expect an increased share of the workforce and companies to remote work as they realize the cost-savings and other benefits.”<sup>10</sup>

They looked at variables related to two key factors that have considerable geographic variation: “1) the availability of digital connectivity and/or 2) the share of workers employed in industries and occupations that are amenable to remote work.” However, instead of focusing on those counties that are best prepared, they “focused on how vulnerable (weak) counties are by looking at the places that have inadequate digital connectivity—including access to the internet and devices—and places where a higher share of workers are employed in industries/occupations that are not remote work friendly.” Counties are then classified on their “vulnerability” as indicated in the table above. Those counties labeled “No” and “Low” are best positioned for growing remote work, while those labeled “High” are very poorly positioned. Those interested can go to the PCRD website to find out how their county is classified, and to access the raw data on which that classification was based.

While these data certainly speak to the potentials for counties to encourage their current workforces to obtain and maintain jobs connected -- at either employers or clients – in distant market areas, it does not address the other important path that through which remote work can spark economic growth: attracting new internet competent residents based on the county’s quality of life offerings and the availability of sufficiently robust internet connections. Savvy economic developers will pursue both strategies.

I have looked at the PCRD data for about 30 suburban and rural counties in NY, NJ, OH, WI, WY, NE, NC, VT, NH and ME that have downtowns I know fairly well. With very few exceptions, they all are rated No or Low, i.e., they have good potentials for developing a “remote workforce.” Since, to my knowledge, few if any, have focused on such a strategy, remote working represents for them a significant untapped viable path for economic growth. This certainly will not be the case with all counties, but it will be for a very significant number of them.

**How Remote Work Helps People and/or Organizations Cope with Crisis Conditions.** There are two important groups whose views and behaviors determine the level of remote working: the employers and their employees. As the data cited above show, remote work has allowed

companies, especially the large ones that produce or use a lot of technology. to stay operational and keep their employees working. That has allowed both the companies and the worker households to keep their financial heads above water during this crisis. It has also dealt with the need for social distancing and allowed the workers to feel safer.

The grave danger of the current crisis, however, creates such a high level of need that it overcomes the long existing concerns about remote work held by both employers and employees. Among those for employers are:

- Can productivity be maintained?
- Can remote workers be adequately supervised?
- Can the corporate culture, team spirit ,and level of spontaneous creativity be maintained?

Prior to the crisis, there were some studies that indicated remote working was more productive than traditional office work.<sup>11</sup> As the HBS report noted, corporate leaders are not finding that during the crisis remote work has reduced productivity, though advocates of the open office workplace concept continue to argue, with no supporting data, that it has reduced creativity. Also, a study by Cushman & Wakefield found that “Productivity can occur anywhere, not just at the office.... During the pandemic, effective team collaboration has reached new heights, through better leverage of remote collaborative technology...”<sup>12</sup>

However, the questions related to the corporate culture, team spirit and levels of creativity remain. The strong collaboration Cushman & Wakefield discovered “is task oriented collaboration and not the kind that creates opportunities for informal learning and mentoring.” Still, it should be noted that while online collaboration tools such as Zoom are, at best, partial substitutes for face-to-face encounters, they are certainly not entirely without merit when it comes to creativity. Researchers are also hard at work to improve their ability to communicate and support emotional understandings, which also can be conducive to creativity.

More promising, corporations are also considering ways for their remote workers to have opportunities for these vital face-to-face meetings by adding hotel conference features and functions to their existing major downtown office locations or creating new suburban locations that would focus on them.<sup>13</sup> If these “hotel offices” stimulate informal meetings, prior research on technology transfer suggests that they could be fairly successful. The advantage of the suburban locations is that remote workers could easily use their cars, instead of public transportation, to get there.

For employees, the concerns have been:

- *Can they create and maintain the internal social connections needed to have a strong upward career path within the company?* On one hand, as just noted above, many corporations are thinking about innovations that could help resolve this problem. However, most of the remote workers I’ve met are career satisficers, who want a really good job they can enjoy, while also have the quality of life they and their families want. They are not those who aspire to rise to their firm’s c-suite.

- *Can they maintain the social connections within the corporation that make work more enjoyable and enhance their ability to be creative?* Coming once a week or twice a month to an office hotel location could be very helpful here. Personally, I been working at home fulltime since 1990, and while I do visit clients and professional friends, and attend conferences, most of my person to person contacts have been by phone or email. I haven't found my remote working has inhibited any creativity on my part.
- *Can they cope with increased demands on their time and attention by other household members since they are spending so much more time at home?* This concern has grown considerably for remote workers with children as the Covid19 crisis has endured and schools stay closed. It will very likely ease as the crisis ebbs and schools reopen.

### **The Important "User Groups" Sparking its Growth and Their Non-Health Reasons for**

**Supporting Remote Work.** An April 2020 survey by Gallop found that: "Three in five U.S. workers who have been doing their jobs from home during the coronavirus pandemic would prefer to continue to work remotely as much as possible, once public health restrictions are lifted. In contrast, 41% would prefer to return to their workplace or office to work, as they did before the crisis." <sup>14</sup> While surveys are just pictures taken at one point in time, even if substantial erosion in the desire for increased remote working in the future has occurred since April, it is still highly likely that such support will be substantially higher than pre-crisis levels.

For employees, remote work offers a number of substantial benefits:

- They are better able to live where they believe that can have the quality of life they are seeking. If there is one thing we can learn from both Richard Florida and Joel Kotkin it is the importance of quality of life in the decision making of creatives/knowledge workers about where they want to live. Remote work can make it easier for them to take their jobs with them or to find new jobs, or to create their own jobs. For many of them who are nesting, but not in the very top income tiers, and living in our very expensive large cities, remote work can enable them to find better and more affordable housing in suburban or rural areas.
- Greatly reducing the aggravation, time spent, and financial costs of commuting. The pre-crisis study, the 2017 State of Telecommuting in the U.S. Employee Workforce, found that: "Full-time telecommuters save over \$4,000 each year ...(and) half-time telecommuting employees save an average of \$2,677 annually in commuting costs."<sup>15</sup>
- They have more time for leisure activities. That same 2017 study found, for example, that: "By not spending time commuting every day, the average (remote) employee also gains back the equivalent of over two workweeks (11 days) per year."
- They have better control over their work schedules.
- They can spend more time with other members of their households.

For employers, there are several possible benefits, but to properly understand them it is important to understand how many corporations and their real estate advisors now see how and where their employees will work in the future. That vision increasingly includes a combination of a lot more remote working with the continued use of office spaces, though how those offices will be used, where they will be located, and how much space will be needed is still being worked through.<sup>16</sup> The conclusions reached will probably vary by firm and industry. Some important considerations are that while remote working serves to reduce the demand for office space, the need for social distancing increases the demand for it. Also in the equation are the safety and service levels of local mass transit and how corporations much really could be saved by moving to cheaper suburban locations.

:

- *Remote Work Reduces Rent Payments.* In our larger downtowns 50% to 60% of the office employees probably are now working remotely and 60% of them want to continue doing so after the crisis. That suggests a probable upper bound of between 30% to 36% in the number who will no longer use downtown office spaces. The 64% to 70% of employees who continue to work downtown, will need greater amounts of space to maintain social distancing. How much that space per worker increase might be will probably vary by each office location. Remote work might serve as a damper on the rising cost of total rents, since its reduces the number of workers needing space, especially when the amount of space per worker must be substantially increased. If the space costs of maintaining social distancing are significantly larger than the savings generated by the remote workers, then corporate leaders might be induced to encourage even more remote working. Or they might decide to follow their remote workers to the suburbs where they can save significantly on office rents. However, it is doubtful that too many would totally give up their prestigious and strategically located locations in our major CBDs. Two other important questions are: how long will the crisis last, and will the larger amounts of space per employee created for social distancing be kept after the health crisis? Bottom line: how the dynamic of remote work pressuring for reduced spaces, while the greater need for social spaces pressures for much larger spaces, will play out on downtown office rents still remains to be seen.
- *Productivity and Creativity.* As noted above, remote workers can increase productivity. The supposed creative benefits of open offices have been called into question, and companies are thinking about ways, such as office hoteling, to facilitate creativity for their remote workers. If many of these remotes now cluster in some suburbs, then the lauded spontaneous interactions might happen on a more informal and decentralized level, perhaps around suburban downtown coffeeshops spas, or gyms.
- *Accessing a larger talent pool.* Many firms in the high tech and FIRE industries are finding it harder to get the talent they want. Recent actions at the federal level, by making it far more difficult to tap foreign talents, especially STEM workers, have worsened that situation. Remote work can help relieve it.
- *Workforce retention.* It always costs a fortune and takes valuable time and effort to replace workers, especially those with considerable talent. Many major employers –

especially those prone to be downtown office tenants -- are now encountering sizeable proportions of their workforces who want to either work mostly on a remote basis or to do so far more often.

One might reasonably argue that the personnel related factors are likely to be the strongest motivators for corporate leaders in today's economies where highly skilled workers have become such a critical asset. It is what differentiates the current remote work trend breeze from the one sparked by the Great Recession. The sheer number of highly skilled people now remote working, liking it, and wanting to do more of it in the future is far larger than ever. Firms that do not offer remote work are likely to lose skilled workers to firms that do. At the same time, the demand for STEM workers continues to grow, while recruitment from abroad has become more difficult.

**Ratio of Median Home Price to Local Median Household Income In some Selected Cities in 2017**

City	Ratio	City	Ratio
Manhattan	15.60	Denver	6.60
San Francisco	13.80	Portland	6.40
Los Angeles	12.10	Chicago	5.90
Boston	10.00	Austin	5.50
San Jose	9.00	Phoenix	5.00
Seattle	8.70	San Antonio	4.70
San Diego	8.30	Houston	4.50
Washington DC	7.50	Charlotte	4.40
Dallas	6.60	Fort worth	4.00

Severely Unaffordable: 5.1 and over  
 Seriously Unaffordable: 4.1 – 5.0  
 Moderately Unaffordable: 3.1 to 4.0  
 Affordable: 3.0 and under.

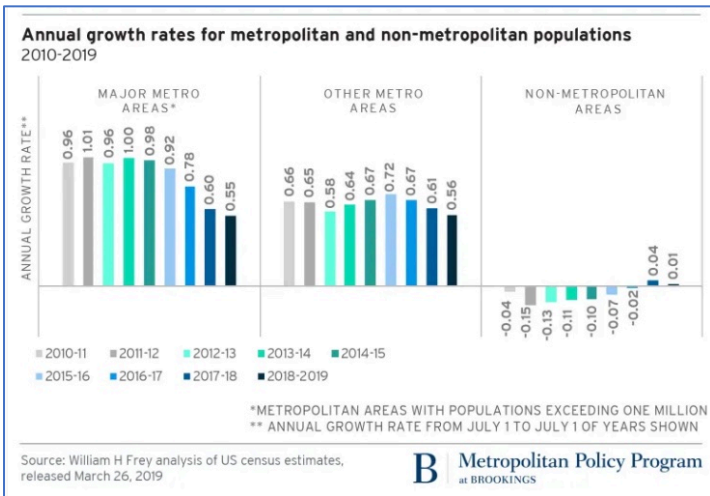

Source: <https://www.businessinsider.com/the-most-unaffordable-housing-markets-in-north-america-2017-10>

**There Other Trends or Trend Breezes That are Reinforcing the Growth of Remote Work**

Housing affordability issues in our large central cities were recharging the movement of households to suburban and rural areas. Remote work enables these movers to take their jobs with them or to get new ones. The skilled workers who want more living space at an affordable price have an incentive to adopt remote working.

That housing affordability was a growing problem in our major cities was well-known many years before the crisis, as the data in the table on the left demonstrates.

William Frey, the well-known demographer, has found that it has contributed to a new flight to the suburbs in our largest metro areas:

“Major metropolitan areas with populations exceeding 1 million sustained the biggest growth slowdowns and, in several cases, population losses over the last four years, as have the urban cores within them.” (See table below).

“This recent demographic dispersal can be attributed to an upturn in the economy and, to a lesser degree, the housing market in the last half of the 2010s. These factors gave young adult millennials and others the wherewithal

to find jobs and homes in suburbs and more parts of the country, which were not available to them in the immediate aftermath of the 2007 to 2009 Great Recession.”<sup>17</sup>

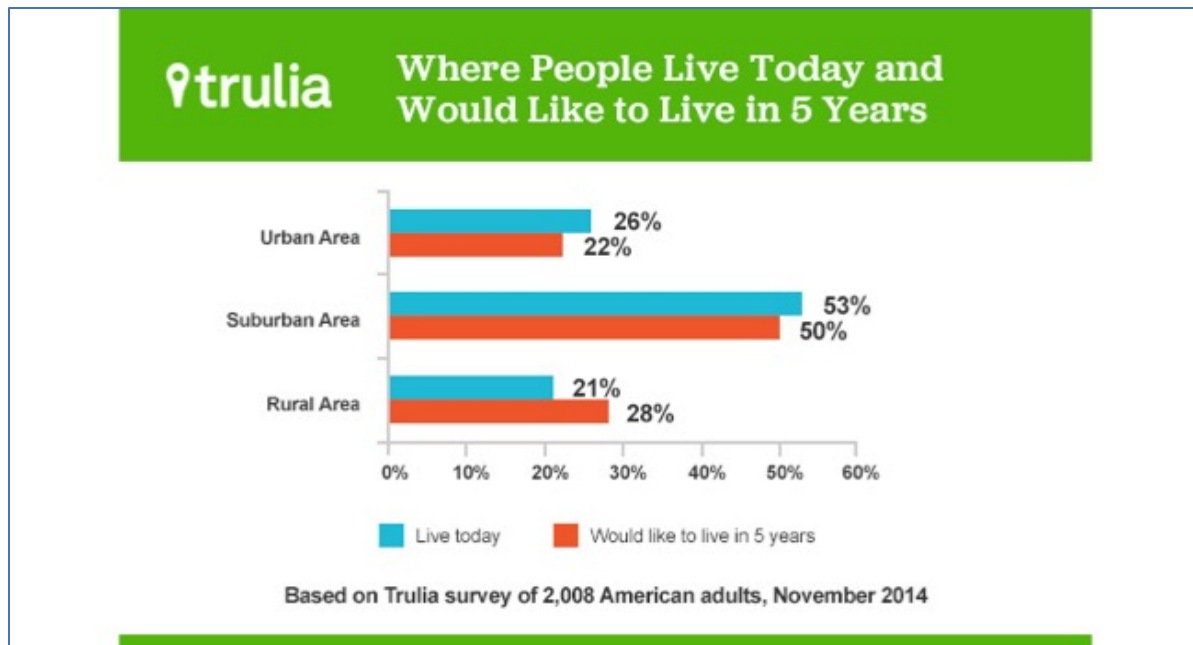

The extent of this flight during the current crisis in the NYC area, and if it will continue on after its ebb, are matters of some debate. Reports of wealthy residents fleeing to their second homes or purchasing them are plentiful, but if that means they are deserting the city completely, or just more often than in the past is unknown. But the current demand by current NYC residents to buy homes in suburban and rural scenic areas has burgeoned, as this recent headline in the New York Times demonstrates: “New Yorkers Are Fleeing to the Suburbs: ‘The Demand Is Insane.’”<sup>18</sup> Similar reports have appeared about the situation in San Francisco.

The huge problems of big city mass transit systems. Public transit systems that are perceived to be unsafe, incapable of providing desired service levels, and/or uncomfortable can motivate workers who might use them to try remote working. Just as Covid19 has hurt people with serious preexisting health conditions the most, so it’s impacts have badly injured companies, industries and transit systems with comparable weaknesses. Prior to the crisis, in 2017, transit ridership, mostly on buses, had fallen in 31 of 35 of our major metropolitan areas, including the seven that serve a majority of transit riders.<sup>19</sup> The subways in NYC were getting slammed for terrible service and failures to implement needed major improvements to signaling for about a decade. NJT Transit was suffering from a myriad of problems, as was the management of the Metro in the Washington DC area.

When Covid19’s impacts really hit with full force, commuter rail “all but disappeared:” ridership on the New York region’s Metro North fell by 95%; Metra, that serves suburban Chicago, fell by 97%; PATCO in suburban Philadelphia had a similar drop. “Heavy rail” ridership also fell nearly as severely: NYC’s subways dropped by about 90%, though it has since rise to about 25% percent; Metrorail in DC also fell by about 90%; San Francisco’s Bay Area Rapid Transit system checked in with a 97% decline, much worse than Los Angeles Metro Rail’s decrease of 75 percent.<sup>20</sup> Many of these former riders were using remote work to keep their jobs.

The emerging problem that may continue to structure public attitudes negatively towards our largest transit systems, and indirectly reinforce remote work, is that their financial futures have become very uncertain. The MTA in NYC, for example, needs to cover a \$16+ billion deficit running through 2024, and other large transit agencies are also facing very significant deficits. These large agencies are also the ones that are very reliant on the farebox for most of their revenues, and that is a very unlikely source for raising the huge amounts of needed new revenues. A Federal bailout seems unlikely unless the Democrats sweep into power in Washington.

Quality of life concerns are bringing people to or back to the suburbs, and small towns in rural areas. Remote work meshes nicely with the strong inclinations of creative/knowledge workers and others to highly value their quality of life because it can enable them to have meaningful and well-paying jobs where they want to live, even if that is far from where their employers/clients are located.

As the chart from Trulia below indicates, not everyone is living now where they want to live, even when it comes to urban, suburban or rural areas. Based on that data, about 7% or 17.3 million of America’s adults would like to live in a rural area, but now don’t. That’s greater than the entire population of Greece, or Hungary, or Sweden. There are probably a significant number of potential remote workers among them.

Back in 2017, I wrote an article about quality of life retail recruitment in towns with populations under about 35,000. In it I noted that new and attractive independent downtown retail shops have been opened in many of these communities by people who moved to them because of the quality of life they offered. Their shops were a way to financially support that quality of life. Some of these downtowns’ best shops were “organically recruited” in this manner, so their economic importance often far outweighs their absolute numbers.

My research on these smaller communities seldom came across any strategy that even mentioned remote workers overtly, though a number were concerned about attracting creative workers, mainly artists who could also attract tourists.<sup>21</sup> In my personal encounters, though, I often met lone eagles who were remote working.

In 2019, I did a follow-up look that dug deeper into the topic of rural creatives and found that

- *Rural areas have people in creative class occupations, but fewer of them.* Urban county workforces have about 30% in creative occupations, while rural ones only have about 20%. Moreover, most rural creatives are not artists, and quite a few are in remote work-prone occupations.
- *People being drawn to small and rural communities by their Q-of-L assets is not a new trend.* This has been going on for some time, especially by “boomerangers,” i.e. returning former residents.

- *The in-migrants are often quite skilled.* However, these skills often are not honed in colleges.
- *While young adults may be leaving, 30-49 year olds may be returning.* Brain gains were often countering brain drains. The boomerangers arrive mostly as family units and it is the family oriented quality of life benefits the small town offers that is a crucial factor in these moves back home.<sup>22</sup>

New remote workers moving to many rural areas will not necessarily face social isolation.

The weakening of the open office workplace paradigm. The weakening of the open office workplace paradigm will remove a significant amount of opposition to remote work from corporate c-suites and their consultariats. Signs of that weakening were appearing prior to Covid19, but that weakening has accelerated fast since virus because it is so out of line with the needs for social distancing. A recent and valuable report by JLL has noted the following about the current status of the open office concept:

- This model focused on increasing worker densities by lowering the worker space ratio to 75 SF to 150 SF per employee from the 325 SF of the 2000s. To counter that crowding, workers were offered lots of communal spaces and amenities such as free food and gyms. “The mixed performance of dense open plans, the new mandate of social distancing today, and the likely lingering psychological effects of this outbreak on employees in the foreseeable future could combine to create some decompression in the workplace.”
- The pandemic is forcing tenants and building owners to rethink the open office communal spaces, shared amenities, as well as crowded “bottlenecks” such as lobbies, elevators, bathrooms, and cafés.
- Very significantly, in 2019, a major study found that under open office plans “face-to-face interactions dropped by 70 percent, when compared to more traditional space, and digital interactions increased to compensate.”<sup>23</sup> So much for open offices facilitating creativity by spontaneous interactions!

As the open office model disappears, there will far fewer attempts to foster worker creativity by crowding them together. That will reinforce further the acceptance of remote work.

**The Potential Post Crisis Impacts of Remote Work That are Significant Enough to Warrant Our Attention.** On Urban Downtowns. The largest impacts on these downtowns will be caused by the number of office workers who no longer work there on a daily basis, be they fulltime or part-time remote workers. That will reduce pedestrian flows – in some locations that might be a good thing – and reduce the sales potentials of many downtown eateries, retailers and personal service operations. In many downtowns, such as in NYC, that is now being felt in extremis, with over 80% of Manhattan’s workforce not in its office buildings. As noted above, I’m estimating that about 30% to 36% in the remote prone industries will continue to work remotely post crisis. Since about 14% were probably already doing so pre-crisis, that means the net increase will be between 16% and 22%. It also means that the office worker market

spending potentials for local merchants to capture will likely be about 16% to 22% less than in the pre-crisis years.

The impact of remote workers on how much downtown office space will be needed and occupied is far less certain, because that will depend more on how many workers are still officed there, how much space each worker will occupy, and the costs of that space. If 78% to 84% of the workers return, but are given 50% more space to allow for proper social distancing, then the tenant will need to rent 17% to 26% more space; 56% to 68% more space if the space per employee ratio is doubled. Then there's the question of rent levels, and tenants will probably want space costs PSF to be reduced as their total space needs increase. Remote work does not incur any space costs for employers. Consequently, office tenants with needs for large increases in space who do not get a PSF rent reduction may become motivated to encourage more remote working -- or to rent cheaper spaces in the suburbs. There is a decent chance the need to increase the space per worker ratio will lead to more workers moving out of our downtowns than does remote working.

To some unknown degree now, remote working is likely to increase the number of people who live in or near the downtown (the live-workers) who decide to move to suburban or rural locations. Early in the crisis, some experts mentioned the possibility of a significant deflation in real estate values. In the housing market, that has not been happening so far for homes that are fairly pricey or above in cost. If enough of these downtown residents leave then downtown housing costs may decline and that might reduce the attraction of remote working.

On Suburban Downtowns. Suburbs are communities that are primarily developed to serve residential needs in terms of housing and supportive operations such as neighborhood retail and personal and professional services. Normally, they are not strong employment centers, since most residents hold jobs located elsewhere in the region. Yet some suburbs, such as Dublin OH and Morristown, NJ are major employment centers. Indeed, these chosen few can have more people working in them than there are residents. Yet a study found that even when large workforces are present, the live-work level in and near the suburban downtowns was only 3.1% compared to 19.1% in the downtowns of independent cities (cities at the cores of small metro or micropolitan areas).<sup>24</sup>

There is a strong and reasonable expectation that a lot of these new remote workers will be either existing suburban residents or former big city residents who move to a suburb. Their biggest economic impacts are their potential daily expenditures; the dollars they used to spend in their center city downtown will be available to their suburban downtown merchants. Most of these remotes will be using home offices to keep expenses down, supplemented by carrying their laptops to nearby coffeeshops and libraries to get a needed change of scenery and possibly developing and enjoying social contacts. The new remotes are unlikely to present any substantial new demand for office space. A few may opt for a coworker space, but probably only on a very part-time basis for social, networking, and noisy household reasons. Coworker spaces also have become very problematic for remotes because of their density and expense, and corporate users appear to like them more than the lone eagles.

The most important impact of the increased number of remote workers may be the potentials they could present for developing in these suburban downtowns far stronger, more supportive, and more attractive entrepreneurial environments. Smart economic developers will begin to think about how they can turn their downtowns into havens for remote workers that can help them do their jobs more easily and more effectively, and then how that also could help attract more startup entrepreneurs. The key types of places in these entrepreneurial environments would be libraries, coffeeshops, eateries, vibrant public spaces, gyms, spas, maker spaces, colleges and community colleges. What also would be needed is a downtown organization that identifies all of those working at home, including these remote workers, and convenes social and informational meetings on a regular basis where they can all meet and get to know each other. This is a task that far too few downtown organizations can or want to take on.

Nationally, about 5% of the workforce works at home. More remote working may translate into significantly more suburbs approaching the 8% to 10% level that would make such an entrepreneurial environment much more viable.

On Rural Towns. Remote working promises to be a real game changer for those rural towns that have adequate broadband – and there are many of them. It’s important to note that large absolute numbers are not required for a significant positive benefit to emerge. Yes, remote work can provide rural workers in remote prone occupations with the ability to win jobs in larger and distant labor markets. However, it also enables the attraction of those who want to live in rural areas, but now don’t, and who have such jobs, or who can create them, or find them. Towns with scenic and leisure assets will be additionally advantaged in attracting such new residents and remote workers. Such “residential recruitment” can bring vital new skills, financial resources, networking contacts, and vitality into a community.

The depopulation of rural areas has been attributed to a lack of well-paying jobs and attractions that motivates their young people to move to more interesting cities with better job opportunities. Remote work promises to reduce the power of that depopulation path while making it easier for more boomerangers to return, often bringing their enhanced skill levels with them.

Many of these rural towns can also develop themselves as havens for remote workers and develop the kind of supportive entrepreneurial environment that the suburban downtowns can develop. Because of their size and consequent modest financial and staff resources, the supportive services for such an environment would probably have to be provided on a regional basis.

**Is Remote Working a Real, Lasting and Potentially Significantly Impactful Trend?** I believe it is because:

- Many workers are remote working and It is now meeting the needs of important groups and organizations, e.g., companies and many of their workers.

- It is not a new trend breeze, and even a few years before the pandemic, its growth had accelerated among firms that are likely to occupy large amounts of downtown office space, though nowhere near the level it would reach during the pandemic.
- There are strong non-health incentives for corporations and workers to continue high levels of remote work after the crisis. For the companies, remote working's ability to help them attract and retain highly skilled people is probably the most important. Also the rival open office model has proven to have no advantages in terms of productivity or creativity. Remote workers provide all sorts of quality of life advantages ranging from greater freedom to live where one wants and can better afford, to having more leisure time and less hassles from commuting, to being better able to adjust one's workday schedule to one's needs and wants.
- There are other trends that reinforce the remote work trend breeze. The foremost is the desire of creative/knowledge workers to live in places that have the quality of life features they prefer. Another is the housing affordability problem in our major cities. A newer one is the bad shape of our biggest public transit systems that today has little prospect of being resolved anytime soon. Finally, the lost glamour of the open office model takes away a conceptual platform for criticizing remote working.
- There is sufficient evidence to believe that it is very probable that remote working will have substantial impacts. It will probably reduce the number of people working in the office buildings of our major downtowns, though not at as high a level as some may have thought. That will be reflected in reduced office worker consumer expenditures in these downtowns. It probably will not, however, directly lead to a reduction in the amount of occupied office space. Suburban downtowns could benefit from new remote workers bringing additional consumer expenditure potentials for their merchants and additional demand for housing. The presence of a significant numbers of them will increase their ability to create a viable and supportive small town entrepreneurial environment. The largest relative potential impacts of remote work will be on rural towns with sufficient broadband access: it will help them to close the brain drain spigot, while opening the one for brain gain. That will ease pressures for depopulation while making it easier for the 17 million+ American adults who prefer to live in rural areas, but now do not, to make that move.
